

Appendix A

Harmonia^{+PL} – procedure for negative impact risk assessment for invasive alien species and potentially invasive alien species in Poland

QUESTIONNAIRE

A0 | Context

Questions from this module identify the assessor and the biological, geographical & social context of the assessment.

a01. Name(s) of the assessor(s):

first name and family name

- 1. Przemysław Śmietana
- 2. Maciej Bonk
- 3. Wojciech Solarz

acomm01.	Comi	ments:		
		degree	affiliation	assessment date
	(1)	dr hab.	Department of Plant Ecology and Environmental Protection, Faculty of Biology, University of Szczecin	25-01-2018
	(2)	mgr	Institute of Nature Conservation, Polish Academy of Sciences in Cracow	10-01-2018
	(3)	dr	Institute of Nature Conservation, Polish Academy of Sciences in Cracow	05-02-2018

a02. Name(s) of *the species* under assessment:

Polish name:	Rak pręgowany
Latin name:	Orconectes limosus (Rafinesque, 1817)
English name:	Striped crayfish

Unia Europejska Fundusz Spójności

Współfinansowano w ramach projektu nr POIS.02.04.00-00-0100/16 pn. *Opracowanie zasad kontroli i zwalczania inwazyjnych gatunków obcych wraz z przeprowadzeniem pilotażowych działań i edukacją społeczną ze środków Unii Europejskiej w ramach Programu Infrastruktura i Środowisko 2014-2020*

acomm02.	Comments:					
	•	more correct name would be striped crayfish – this species has no stripes as such, the ots on the abdomen resemble stripes. Another common name for it is American crayfish.				
	Polish name (synonym I) Rak amerykański	Polish name (synonym II) Rak pręgowaty				
	Latin name (synonym I) <i>Astacus limosus</i>	Latin name (synonym II) <i>Faxonius limosus</i>				
	English name (synonym I) American crayfish	English name (synonym II) Spinycheek crayfish				

a03. Area under assessment:

Poland

acomm04.

acomm03. Comments:

a04. Status of the species in Poland. The species is:

Comments:

	native to Poland
	alien, absent from Poland
	alien, present in Poland only in cultivation or captivity
	alien, present in Poland in the environment, not established
Х	alien, present in Poland in the environment, established

aconf01.	Answer provided with a	low	medium	high	
				Х	

level of confidence

The most common and the most numerous crayfish in Poland. In Pomerania (Western Pomerania, Central and Gdańsk Pomerania) at least 865 habitats were found (Śmietana 2011, 2013 – P) and over 1383 in the whole country(Pockl et al. 2006 – P). Large ecological plasticity translates into the species adaptation to the conditions offered by very diverse water habitats. It occurs in waters flowing from small watercourses (however, it avoids the upper course i.e. the land of trout, which includes the upper course of the stream together with the spring zone, with cold (temperature does not exceed 10 °C), transparent and rapidly flowing water, stony and gravel bottom, to large rivers like Vistula and Oder. It is found in all types of reservoirs from lobelia lakes to hypertrophic fire reservoirs, as well as from ponds, through all types of lakes (except acidified and mountain), to coastal waters of the Baltic Sea (Szczecin Lagoon, Vistula Lagoon, Pomeranian Bay, Gulf of Gdańsk) (Leather 2007 – I, Śmietana 2013 – P, Karolak 2017 – I, Szaniawska et al. 2017 – P). A series of new habitats not presented in the foregoing works were found recently slightly south of the known species border in Poland (Bonk et al. unpublished). However, this species probably does not occur in the south-eastern part of the country and most of the Polish Carpathians (Kouba et al. 2014 – P, Bonk et al. 2017 – A).

a05. The impact of *the species* on major domains. *The species* may have an impact on:

- X the environmental domain
- the cultivated plants domain
- **X** the domesticated animals domain
- **X** the human domain
- **X** the other domains

acomm05. Comments:

The species mainly affects native crayfish as a disease vector (e.g. Kozubíková et al. 2011, Śmietana 2011 - P) a competitor and stress factor, among others to fish – for example by

occupying the same hiding places (Hirsch and Fischer 2008 – P). It also affects mass and energy flow in water ecosystems (Hartel-Borer et al. 2005 – P). The impact on other constituents of aquatic habitats and biocenoses is relatively poorly researched, yet no strong impacts have been found so far, translating into a decline in the level of biodiversity. The species digs burrows (e.g. Holdich and Black 2007 – P, Bonk – A), may potentially have an impact on other objects, e.g. on ponds, etc. The species found in breeding ponds (Nowak 2017 – A) – may compete with fish for food. The impact on people is minimal. Fishermen, anglers and other people using open water can be hurt when catching the striped crayfish (Bonk – A).

A1 | Introduction

Questions from this module assess the risk for *the species* to overcome geographical barriers and – if applicable – subsequent barriers of captivity or cultivation. This leads to *introduction*, defined as the entry of *the organism* to within the limits of *the area* and subsequently into the wild.

a06. The probability for *the species* to expand into Poland's natural environments, **as a result of self-propelled expansion** after its earlier introduction outside of the Polish territory is:

low med X high					
aconf02.	Answer provided with a	low	medium	high X	level of confidence
acomm06	Comments: The species is found in the P). A2 | Establishment

Questions from this module assess the likelihood for *the species* to overcome survival and reproduction barriers. This leads to *establishment*, defined as the growth of a population to sufficient levels such that natural extinction within *the area* becomes highly unlikely.

a09. Poland provides **climate** that is:

non-opt sub-opt X optimal		ecies			
aconf05.	Answer provided with a	low	medium	high X	level of confidence
acomm09.	Comments:				
	The species comes from a 2002 – P). In addition, the Europe, indicate the exist The current climatic cond than the native noble cray largely a post-glacial relic noble crayfish in Pomerani lower human pressure exeffects of anthropopressic watercourses, eel fry-stock of the striped crayfish (Śm similarity of climates incluclimatic conditions largely	history of cha ence of extre itions are clea fish (Śmietan . a10. Poland provides habitat that is

sub-	-optimal optimal mal for establishment of <i>the spe</i>	cies			
aconf06.	Answer provided with a	low	medium	high X	level of confidence

acomm10. Comments:

The species is characteristic of lowland waters (e.g. Talbot 1985 as cited in Śmietana 2011 – P). High adaptive ability, however, predestines this species to occupy a wide spectrum of aquatic habitats in Poland. It is common in many habitats like medium and large rivers,

canals, small rivers and streams, lakes, ponds, clay pits, dammed reservoirs (Śmietana 2011 – P, Bonk – A), its presence is also found in the brackish waters of the Baltic Sea, where it may reproduce (Szaniawska et al. 2017 – P). It is not found in the upper cuts of watercourses (trout land) and tanks with low pH (less than 5.5). In particularly favorable conditions, it periodically creates very large populations. Anthropogenic changes in habitats, including the growth of trophies and pollution, do not constitute a habitat barrier for this species (Śmietana 2013 – P). It does not have the bioindication value of high-quality habitats, as it is in the case of noble cancer.

A3 | Spread

Questions from this module assess the risk of *the species* to overcoming dispersal barriers and (new) environmental barriers within Poland. This would lead to spread, in which vacant patches of suitable habitat become increasingly occupied from (an) already-established population(s) within Poland.

Note that spread is considered to be different from range expansions that stem from new introductions (covered by the Introduction module).

a11. The capacity of the species to disperse within Poland by natural means, with no human assistance, is:

very low low medium high X very high					
aconf07.	Answer provided with a	low	medium	high X	level of confidence
acomm11.	Comments: Expansion of population (d The spreading of this spee continuity of the habitat watercourses and reservoi is worth noting, however, with each other by rivers of penetrated to most of the enables it to have virtually that transverse restriction species. This is evidenced b systems, which is particul (Śmietana 2013 – P). Population expansion: the km a year (Hudina 2009 – also be adopted in Poland, apart as well (Puky 2014 terms of spreading. Sponta as very limited and rather a	cies without I , i.e. it is por rs. Under such that a signific r canals, which e main river I unlimited por s, such as we by the current larly visible established p P). Therefore The species – P), which a aneous mover	ossible if then in conditions, the cant part of lak chenables effe basins in Polar ssibilities for d eirs and dams distribution of on the basis pace of master r, it is a very la is able to mov additionally, b ment between	re are water his species car ses and other ective dispersion nd, so the ne ispersion by v do not cons f the striped c of results co ring new areas rige expansion e between tai ut slightly, in- isolated basin	connections between n spread very quickly. It reservoirs is connected on. The species has also stwork of watercourses vater. It is worth noting stitute a barrier to this trayfish in Poland's river ollected for Pomerania s in Europe is 2.5 to 24 n capacity which should nks that are not too far creases its potential in as should be considered

a12. The frequency of the dispersal of *the species* within Poland by **human actions** is:

X	low medium high					
acon	1f08.	Answer provided with a	low	medium	high X	level of confidence

acomm12. Comments:

Lack of detailed data, yet frequent occurrence and potential use of the species as a fishing bait, are circumstances conducive to its rapid spread. Lack of awareness of the occurrence of different species of crayfish and the ability to recognize them, is a highly harmful synergy in the spread of the species with the participation of humans. Striped crayfish is introduced as an excess of unused bait, with fishing gear during fry-stocking and willfull introduction of crayfish (Holdich and Black 2007, Śmietana 2013 – P). Over 10 years, at least 10 habitats of the striped crayfish were destroyed this way in Pomerania (Śmietana 1998-2017, 2014-2016 – N). The scale of crayfish dislocations is probably large and the transfer to distances over 50 km may occur more often than 10 times per decade.

A4a | Impact on the environmental domain

Questions from this module qualify the consequences of *the species* on wild animals and plants, habitats and ecosystems.

Impacts are linked to the conservation concern of targets. Native species that are of conservation concern refer to keystone species, protected and/or threatened species. See, for example, Red Lists, protected species lists, or Annex II of the 92/43/EWG Directive. Ecosystems that are of conservation concern refer to natural systems that are the habitat of many threatened species. These include natural forests, dry grasslands, natural rock outcrops, sand dunes, heathlands, peat bogs, marshes, rivers & ponds that have natural banks, and estuaries (Annex I of the 92/43/EWG Directive).

Native species population declines are considered at a local scale: limited decline is considered as a (mere) drop in numbers; severe decline is considered as (near) extinction. Similarly, limited ecosystem change is considered as transient and easily reversible; severe change is considered as persistent and hardly reversible.

a13. The effect of *the species* on native species, through predation, parasitism or herbivory is:

inapplic low mediun X high					
aconf09.	Answer provided with a	low	medium X	high	level of confidence
acomm13.	Comments:				
	The problem of significan (Śmietana 2011 – P) has no in some populations, this probable and dangerous f There are confirmed cases accidental interaction rel (Sakowicz and Kompowski its impact on native mollus threaten, for example th <i>Anodonta cygnea</i> (EN cate extinction in the near futur on laboratory tests sugges prefers vegetable food (Or potentially significantly aff	ot been studie can definite or special car s of eating the ated to eatin 1961 – P). (2017 – P) based in waters. The species

a14. The effect of the species on native species, through competition is:

aconf10.	Answer provided with a	low	medium	high	level of confidence
				X	

acomm14. Comments:

A highly competitive species for the native species of noble crayfish Astacus astacus (an endangered species (VU) according to IUCN and The Polish Red Data Book of Animals, Krzywosz and Śmietana 2004 – P) and narrow-clawed crayfish Astacus leptodactylus (Śmietana 2013 – P). VU vulnerable category – it is given to species that may quite soon become extinct, though not as fast as endangered species, which are given the EN status (endangered). Coexistence with indigenous species always ends with the displacement of the native one. Among the decisive mechanisms there are: transmission of the plague and the competitive advantage resulting from a different life strategy (r). This strategy is typical for species living in conditions of strong competition and is characterized, among others, by short life expectancy, rapid start of reproduction and achievement of maximum fertility, fast pace of individual growth. Native crayfish use a completely different life strategy type "K". In the case of striped crayfish, strategy type "r" determined by higher fertility, faster growth rate especially in the first year of life (Śmietana 2008, 2013 - P), lower susceptibility to predation, including fishing exploitation, interference (disruption) of the noble crayfish mating process (Śmietana 2016 – P) consisting in the attempts of mating O. limosus males with A. asatcus females, which often results in the loss of laying and mutilation of noble crayfish females. The results suggest that interspecies interactions between these two species may contribute to the displacement of noble crayfish (Musil et al. 2010 - P). Prognosis concerning the prevalence of noble crayfish in Pomerania indicate that if the rate of expansion of striped crayfish is not stopped, the rate of disappearance of the native crayfish population will increase at least four times (Śmietana 2013 – P). A drastic reduction in the number of noble crayfish in the Cracow Dabski Pond may be associated with the emergence of striped crayfish (Stanek et al. 2015 – I). Furthermore, he species competes for habitats with native species of fish in Europe (e.g. with burbot (Lota lota), Hirsch and Fischer 2008 - P). It may compete with such fish species as: Amur bitterling (Rhodeus sericeus) and spined loach (Cobitis taenia), yet there is no data on this subject (Śmietana 1998-2017, 2014-2016 - N).

a15. The effect of *the species* on native species, through interbreeding is:

A4b | Impact on the cultivated plants domain

Questions from this module qualify the consequences of *the species* for cultivated plants (e.g. crops, pastures, horticultural stock).

For the questions from this module, consequence is considered 'low' when presence of *the species* in (or on) a population of target plants is sporadic and/or causes little damage. Harm is considered 'medium' when *the organism's* development causes local yield (or plant) losses below 20%, and 'high' when losses range >20%.

a19. The effect of *the species* on cultivated plant targets through **herbivory or parasitism** is:

X	inapplica very low low medium high very high					
acor	ıf15.	Answer provided with a	low	medium	high X	level of confidence
acon	nm19.	Comments: In Poland, no aquatic plan may have a limited negativ	•	. However, if su	ch crops are	introduced, the species

a20. The effect of *the species* on cultivated plant targets through competition is:

X	inapplica very low low medium	,				
	high very hig	h				
acon		Answer provided with a	low	medium	high	level of confidence
acomm20.		Comments: This species is not a plant.				

a21. The effect of *the species* on cultivated plant targets through **interbreeding** with related species, including the plants themselves is:

X	inapplic no / ver low medium high very hig	y low				
acon	f17.	Answer provided with a	low	medium	high	level of confidence
acom	1m21.	Comments: This species is not a plant.				

a22. The effect of *the species* on cultivated plant targets by affecting the cultivation system's integrity is:

Х	very low	,				
	low medium high very higl					
acor	nf18.	Answer provided with a	low	medium	high X	level of confidence

acomm22. Comments:

In Poland, no aquatic plants are grown. If such crops are introduced, the species may have potential effects through its herbivorousness. Less important is the indirect influence of the species on water structures.

a23. The effect of *the species* on cultivated plant targets by hosting **pathogens or parasites** that are harmful to them is:

X	very low low medium high very hig					
асон	nf19.	Answer provided with a	low	medium	high X	level of confidence
acoi	mm23.	Comments: The species is not a vector	of pathogen	s and plant para	sites.	

A4c | Impact on the domesticated animals domain

Questions from this module qualify the consequences of *the organism* on domesticated animals (e.g. production animals, companion animals). It deals with both the well-being of individual animals and the productivity of animal populations.

a24. The effect of *the species* on individual animal health or animal production, through **predation or parasitism** is:

inapplic very low low mediun X high very hig	n				
aconf20.	Answer provided with a	low	medium X	high	level of confidence
acomm24.	Comments:				
	The species may be conflictin (Sakowicz and Kompowski can come into contact with ponds, which means that th other hand, the effect on pa Due to attempts to interbre	1961 – P). a29. The effect of *the species* on human health, by hosting **pathogens or parasites** that are harmful to humans, is:

)	inapplic very low low medium high very hig	1				
a	conf25.	Answer provided with a	low	medium	high X	level of confidence
a	comm29.	Comments:				
	There are no known pathogens and parasites that could be transmitted by the species and that could endanger a human being. Possible infection may occur in the case of human injury caused by crayfish. Pathogens causing possible infections are not specific to striped crayfish and there are no indications that they are common, i.e. capable of causing infection in both humans and crayfish.					

A4e | Impact on other domains

Questions from this module qualify the consequences of *the species* on targets not considered in modules A4a-d.

a30. The effect of the species on causing damage to infrastructure is:

X	very low low medium high very high					
acor	nf26.	Answer provided with a	low	medium	high X	level of confidence
acor	nm30.	Comments:				
	Burrow digging species (Gherardi et al. 2002 – P) may constitute a potential locally hig threat to the sustainability of flood control infrastructure, e.g. earthworks, dams of embankments. The frequency of impacts of varying strength on buildings and fortification can be relatively large, whereas the effect should generally be reversible.					

A5a | Impact on ecosystem services

Questions from this module qualify the consequences of *the organism* on ecosystem services. Ecosystem services are classified according to the Common International Classification of Ecosystem Services, which also includes many examples (CICES Version 4.3). Note that the answers to these questions are not used in the calculation of the

overall risk score (which deals with ecosystems in a different way), but can be considered when decisions are made about management of *the species*.

a31. The effect of the species on provisioning services is:

X	moderat neutral moderat	ntly negative tely negative tely positive ntly positive				
acor	nf27.	Answer provided with a	low	medium	high X	level of confidence
acor	nm31.	Comments:				
	Due to the fact that it is possible to transmit plague to native crayfish farms, this impact may be large, but due to a small number of such types of farms currently existing, the final assessment is moderately negative. This species can also have a negative impact on the					

a32. The effect of *the species* on regulation and maintenance services is:

economically acquired fish.

X	moderat neutral moderat	ntly negative tely negative tely positive ntly positive				
acor	nf28.	Answer provided with a	low	medium X	high	level of confidence
acor	mm32.	Comments:				
The species is important for the mass and energy flow in ecosystems through food effective on macrophytes (Hartel and Borer 2005 – P). Thus, as a herbivore, it can affect the aquative vegetation. Due to the fact that as a result of human impact, there are a number of advect changes in habitats, it is difficult to assess the absolute level of impact resulting only from the activity of the species at the level of regulatory services. The assessment was based						it can affect the aquatic are a number of adverse pact resulting only from

a33. The effect of the species on cultural services is:

the precautionary principle.

(Śmietana 2016 – P).

modera neutral X modera	intly negative tely negative tely positive intly positive				
aconf29.	Answer provided with a	low	medium X	high	level of confidence
acomm33.	Comments:				
Due to a strong establishement in the Polish culture (e.g. culture of speech) of the noble crayfish, the striped crayfish through its commonness, enables a certain conceptual continuity in the sense of catchphrases or proverbs containing the word "crayfish". Due to lack of protection and the availability of striped crayfish, it is used as a culinary object in the local cuisine (e.g. Kashubian) and festivities promoting the protection of native species					

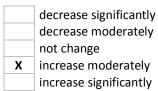

A5b | Effect of climate change on the risk assessment of the negative impact

of the species

Below, each of the Harmonia^{+PL} modules is revisited under the premise of the future climate. The proposed time horizon is the mid-21st century. We suggest taking into account the reports of the Intergovernmental Panel on Climate Change. Specifically, the expected changes in atmospheric variables listed in its 2013 report on the physical science basis may be used for this purpose. The global temperature is expected to rise by 1 to 2°C by 2046-2065.

Note that the answers to these questions are not used in the calculation of the overall risk score, but can be but can be considered when decisions are made about management of *the species*.

a34. INTRODUCTION – Due to climate change, the probability for *the species* to overcome geographical barriers and – if applicable – subsequent barriers of captivity or cultivation in Poland will:

aconf30.	Answer provided with a	low	medium X	high	level of confidence
acomm34.	Comments:				
	The current distribution of the species (e.g. Kouba et al. 2014 – P) suggests that it does not colonize mountain areas. Increasing the temperature can facilitate colonization of colder				

colonize mountain areas. Increasing the temperature can facilitate colonization of colder mountain watercourses (in lower locations of trout land).

a35. ESTABLISHMENT – Due to climate change, the probability for *the species* to overcome barriers that have prevented its survival and reproduction in Poland will:

urvival and reproduction in P	oland will:			
• •				
nge				
emoderately				
e significantly				
Answer provided with a	low	medium X	high	level of confidence
r	e significantly e moderately nge e moderately e significantly	e moderately nge e moderately e significantly	e significantly e moderately nge e moderately e significantly Answer provided with a low medium	e significantly e moderately nge e moderately e significantly Answer provided with a low medium high

acomm35. Comments:

The species occurs and reproduces in Poland – there are no barriers mentioned above in most areas of the country. However, there may be colonization of previously inaccessible cool submontane and montane streams, and in the lower rivers of the trout land.

a36. SPREAD – Due to climate change, the probability for *the species* to overcome barriers that have prevented its spread in Poland will:

X	decrease not char increase	e significantly e moderately nge moderately significantly				
aco	nf32.	Answer provided with a	low	medium X	high	level of confidence

acomm36. Comments:

The current distribution of the species (e.g. Kouba et al 2014 - P) suggests that it does not colonize mountain areas. Increasing the temperature may facilitate the colonization of colder mountain watercourses and those of such character (e.g. Pomeranian rivers). The increase in average temperatures of inland waters will contribute to the increase of ecological resilience (higher fertility, faster growth rate) of this relatively thermophilic species.

a37. IMPACT ON THE ENVIRONMENTAL DOMAIN – Due to climate change, the consequences of *the species* on wild animals and plants, habitats and ecosystems in Poland will:

X	decrease not char increase	e significantly e moderately nge e moderately e significantly				
aco	nf33.	Answer provided with a	low	medium	high X	level of confidence
aco	mm37.	Comments:		of inland water		

The increase in average temperatures of inland waters will contribute to the increase of ecological resilience (higher fertility, faster growth rate) of this relatively thermophilic species. The impact may also increase in the case of colder water courses, where suboptimal conditions prevail.

a38. IMPACT ON THE CULTIVATED PLANTS DOMAIN – Due to climate change, the consequences of *the species* on cultivated plants and plant domain in Poland will:

X	decrease not chai increase	e significantly e moderately nge e moderately e significantly				
aco	nf34.	Answer provided with a	low	medium	high X	level of confidence
aco	mm38.	Comments:	the plants a	rown in Poland		

The species does not affect the plants grown in Poland.

a39. IMPACT ON THE DOMESTICATED ANIMALS DOMAIN – Due to climate change, the consequences of *the species* on domesticated animals and animal production in Poland will:

X	decrease decrease not char increase	e significantly e moderately nge moderately significantly				
acon	f35.	Answer provided with a	low	medium	high X	level of confidence
acom	nm39.	Comments:				
		Climate change may caus higher rate of metabolism may increase its negative traits of the species.	of this cold-	blooded organ	ism in some	pond fish farms, which

a40. IMPACT ON THE HUMAN DOMAIN – Due to climate change, the consequences of *the species* on human in Poland will:

X	decreas not cha increase	se significantly se moderately nge e moderately e significantly				
асон	nf36.	Answer provided with a	low	medium	high X	level of confidence
acoi	mm40.	Comments:				

This impact is currently very small and results from aggressiveness of this species when captured. There is no reason to conclude that climate change will significantly affect the behavior of crayfish, as well as the frequency of events involving them. On the other hand, higher ambient temperature significantly increases the motor efficiency of this cold-blooded organism (Holdich et al. 2002 - P), potentially increasing the probability of pinching and its strength.

a41. IMPACT ON OTHER DOMAINS – Due to climate change, the consequences of *the species* on other domains in Poland will:

X	decrease not char increase	e significantly e moderately nge moderately significantly				
acor	nf37.	Answer provided with a	low	medium X	high	level of confidence
acor	nm41.	Comments:				
	Higher ambient temperature significantly increases the motor efficiency of this cold- blooded organism and ecological resilience. One can expect an increase in the probability of damage to hydraulic equipment (dams, embankments), caused by a greater number of					

more active crayfish digging their burrows.

Summary

Module	Score	Confidence
Introduction (questions: a06-a08)	1.00	1.00
Establishment (questions: a09-a10)	1.00	1.00
Spread (questions: a11-a12)	1.00	1.00
Environmental impact (questions: a13-a18)	0.67	0.83
Cultivated plants impact (questions: a19-a23)	0.00	1.00
Domesticated animals impact (questions: a24-a26)	0.83	0.67
Human impact (questions: a27-a29)	0.13	1.00
Other impact (questions: a30)	0.50	1.00
Invasion (questions: a06-a12)	1.00	1.00
Impact (questions: a13-a30)	0.83	0.90

Overall risk score	0.83	
Category of invasiveness	very invasive alie	en species

A6 | Comments

This assessment is based on information available at the time of its completion. It has to be taken into account. However, that biological invasions are, by definition, very dynamic and unpredictable. This unpredictability includes assessing the consequences of introductions of new alien species and detecting their negative impact. As a result, the assessment of the species may change in time. For this reason it is recommended that it regularly repeated.

acomm42. Comments:

Striped crayfish is currently a species widespread in Poland. The only place it does not occurr is the Carpathians, which may be the result of an inconvenient habitat and climatic conditions, or a considerable distance from the dispersion centers (colonization of the area of Poland for this species runs from North to South). Research to answer these questions will be undertaken in the near future (Bonk et al. 2017 – A). This species always displaces the native noble crayfish in case of their coexistence and is one of the most important factors determining the extinction of the native species on the Polish Lowlands (Śmietana 2013 – P). The presence of plague is particularly dangerous, but not all populations are carriers of the most virulent strains of this oomycete, as there are a few mixed populations of noble and striped crayfish, and populations with no infected striped crayfish (Śmietana 2013 – P). Nevertheless, noble crayfish, despite the lack of mass mortality, are in regress in such situations. One such situation is well documented (Krakow, Stanek et al. 2015 – I). The species has great potential for spreading, hence one should expect further pressure put on noble crayfish.
